New Training Programs to Help Power System Engineers Overcome Many of Today's Greatest Challenges

Has your boss ever asked you to conduct a task you simply don't have the expertise to perform? Or have you ever been a boss who doesn't have a team with the necessary skills?

These types of problems are becoming ever more prevalent in the power industry today with retiring experts and an influx of junior level engineers. To highlight these challenges Siemens PTI Power Academy TD-NA recently released a white paper titled "Training Needs in the Power Industry". This white paper not only highlights the "skills gap" in the power industry but also the 40+ years of training partnership between Siemens Power Academy and Consolidated Edison of New York, providing expert training to over 2,000 engineers. Building from this successful history, Siemens Power Academy recently launched four new expert level training programs, shown in Figure 1.

These programs bring the knowledge and skills of Siemens globally recognized instructors to help develop the expert engineers of the future. Each program is extensive and comes with online testing, mentoring sessions, learning credits and flexible delivery options.
