The SDV6 family is the latest generation of the successful SDV product line. Ratings have been expanded, and the highly reliable type 3AH operators are now incorporated. With over 7,000 type SDV units and 350,000 type 3AH operators in service, you can rely on Siemens products to meet your distribution system demands.

Type SDV6 distribution circuit breaker

The type SDV6 product line encompasses three voltage groups: 15.5 kV, 27.6 kV and 38 kV. Each group is specifically designed to optimize space and material for the voltage class while retaining common features across the entire product line.
Standard features
- Type 3AH3 operating mechanism
- Trip and close coil
- Visual circuit breaker status window
- Operations counter
- Mechanical position indicator
- External pull-to-trip handle
- Generous relay and metering space
- Hinged panel for relays or devices
- Necessary terminal blocks and wiring
- Fused knife-switch control voltage disconnects
- Porcelain dry-type roof bushings
- Bolted cabinet construction
- Permanent lifting eyes (2)
- Adjustable galvanized legs (4)
- Corrosion resistant powder paint finish (ANSI-61 light gray)
- Stainless steel external ground pads (2)
- Stainless steel external hardware
- Cabinet heaters to prevent condensation
- Filtered ventilation
- ANSI rain-tested design (per ANSI C37.20.2-1999).

Ratings available:

15.5 kV
20 kA or 25 kA
1,200 A or 2,000 A
110 kV BIL

15.5 kV
31.5 kA or 40 kA
1,200 A, 2,000 A or 3,000 A
110 kV BIL

27.6 kV
20 kA or 25 kA
1,200 A or 2,000 A
150 kV BIL

38kV
20 kA, 25 kA, 31.5 kA or 40 kA
1,200 A or 2,000 A
200 kV BIL

Standards
The type SDV6 meets the following standards:
- IEEE C37.04-1999 rating structure for AC HV circuit breakers
- IEEE C37.09-1999 test procedure for AC HV circuit breakers
- IEEE C37-06-2009 preferred ratings AC HV circuit breakers
- NEMA SG-4-2009 AC HV circuit breakers.
Seismic
When specified, the type SDV6 distribution vacuum circuit breaker can be provided with the capability of maintaining structural integrity during and following a seismic disturbance, as appropriate for the specified UBC zones 1-4, IBC-2006 or IEEE 693 levels.

Options
- Terminal connectors for bushings
- Terminal connectors for ground
- Current transformers (up to 2/bushing)
- Capacitor trip unit for AC tripping supply
- Second trip coil
- Undervoltage trip device
- Additional auxiliary switch contacts
- Siemens protective relays
- Other protective relays
- Circuit breaker control switch with indicating lights
- Local/remote or toggle switches
- Additional heaters for -40 °C application
- 1/2 voltage heaters
- Adjustable thermostat
- Seismic capability (IEEE 693 high level)
- Interior convenience outlet (GFCI)
- Interior light with switch
- Molded case circuit breakers in lieu of fused knife switches
- Wire markers.

Maintenance interval
If applied under ANSI “usual service” conditions, maintenance is only needed at intervals of five years/10,000 operations on any circuit breaker in an outdoor application.

Circuit breaker
Siemens has been manufacturing medium-voltage vacuum circuit breakers for over 30 years and has over 350,000 vacuum circuit breakers in service throughout the world. Siemens designs, develops and tests circuit breaker operators and interrupters at its circuit breaker Center of Competence in Berlin, Germany. Design (type) short-circuit tests are performed at independent power test laboratories. Design configuration of the operating mechanism is controlled from Berlin to assure that circuit breakers assembled at any of the regional manufacturing centers will meet the performance requirements of the design.

Operator
The type 3AH3 circuit breaker operator is a durable and reliable stored-energy mechanism. This operator will perform up to 10,000 operations before overhaul, and the basic operator in the 3A family has a MTBF of over 12,000 years (as of 2006).
The type SDV6 outdoor distribution circuit breaker utilizes the type 3AH3 stored-energy operating mechanism. The type 3AH3 is the latest member of the type 3A operator family, of which over 350,000 units are in service worldwide in vacuum circuit breakers. Over 60,000 type 3AH3 operators are in service.

The type 3AH3 operator builds on the vast experience with the type 3A family of operating mechanisms. Improvements in the operator have been incorporated to enhance service life and simplify maintenance. Newer lubricants and alternative bearing materials have been selected to reduce the chance for interaction between the lubricants and the metals to assure long service life. Mounting provisions for devices, such as the opening latch, closing latch and similar items, are designed for one-person removal and installation, even though it is unlikely that the user will ever need to do so. Reusable spring clips are used for pivot pins, avoiding the need for special removal tools or a supply of special purpose retainers during maintenance.

An option for faster opening time for the operator has been incorporated, which decreases interrupting time from the standard 5-cycle (83 ms) interrupting time to an optional 3-cycle (50 ms) interrupting time. This option is only available if the tripping power supply voltage is 48 Vdc, 125 Vdc, 250 Vdc or capacitor trip.

The type 3AH3 operator is a true stored-energy operating mechanism. Closing springs are charged electrically immediately following a closing operation, and the opening spring is charged by the rotation of the circuit breaker main shaft during the closing operation.

The spring charging mechanism is a gear-drive design. Compared to a ratchet-and-pawl mechanism, the type 3AH3 operator is quieter and exhibits longer mechanical life. The estimated total mechanical endurance of the operator is 60,000 operations with overhaul and vacuum interrupter replacement at 10,000 operations.

The recommended maintenance interval for the operating mechanism is five years or 10,000 operations, whichever occurs first, when used in the ANSI/IEEE “usual service conditions.”

The entire type SDV6 family, from 15.5 kV through 38 kV, uses the same basic type 3AH3 operating mechanism. The operators differ only in elements related to the design voltage or interrupting rating of the circuit breaker. The components that differ according to rating include: the main rotating shaft, contact pressure springs, closing spring, opening spring and pushrods, as well as the high-voltage elements, such as the interrupter, standoff insulators and similar items.

Over 350,000 type 3A operators are in service on vacuum circuit breakers worldwide.
**Vacuum interrupters**

At the heart of the medium-voltage circuit breaker are the vacuum interrupters. Siemens vacuum interrupters use chrome-copper contact material, which keeps the chopping current to 5 amperes or less and thereby keeps overvoltages to a minimum.

For 15.5 kV and 27.6 kV circuit breakers up to 25 kA, radial magnetic field contacts are used to force high current (>10 kA) arcs to rotate rapidly around the contact surfaces to reduce contact erosion.

For 15.5 kV 31.5 kA and 40 kA and all 38 kV circuit breakers, axial magnetic field contacts are used, which force the arc to remain diffused, thus preventing excess contact erosion.

The Siemens vacuum interrupter will interrupt up to 100 full-rated faults (depending on rating) before replacement is necessary. A contact-wear indicator is provided to directly determine the wear of the contacts within the vacuum interrupter.

Footnotes:

1 Optional 50 ms (3 cycles) with 48 Vdc, 125 Vdc or 250 Vdc trip voltage or capacitor trip.

2 TRV values are in accordance with IEEE C37.06-2009. TRV peak value u<sub>c</sub> is roughly equal to historic E<sub>2</sub> value in ANSI C37.06-2000. Value t<sub>3</sub>, time to voltage u<sub>c</sub>, is approximately 1/1.138 times the T<sub>2</sub> value in ANSI C37.06-2000.

3 First value is full-wave impulse withstand circuit breaker open or closed. Second value is chopped-wave impulse withstand, applicable only with circuit breaker closed.

4 First value is for standard 83 ms/5-cycle interrupting time. Second value is for optional 50 ms/3-cycle interrupting time (see note 1).
